

# HOW TO STORE AND PROTECT WOOD PELLETS

The pellet  storage before using doesn't need a special care but it is necessary to take precautionary measures **to assure the product integrity until the use.**

Before starting with the precautionary measures to use, it is necessary to provide additional information:

- Pellet  consumption in Italy: about 3 million tonnes (about 3 million pallets and 125,000 trucks), in Austria ca. 1 million tonnes (about 42.000 trucks).
- A logistic support is necessary to assure the distribution of such a high quantity of goods.

good storage with plastic cover (on pallets) in outdoor areas

The wood pellet  is normally sold in 15 Kg bags of polyethylene, which offer a good protection from rain and snow. The bags however are sensitive to the UV ray which spoil the polyethylene. For this reason **the outdoor storage needs the use of a cover protection** (made in polyethylene with anti UV Ray protection). In this way the bags are protected from the deterioration and the damage caused by rain, snow and humidity which are responsible of the raised value of pellet  humidity, reducing the heating power and increasing the ash content.

This way of protection, **rapid, practical and cheap**, could be used from the logistic operators which take care of the pellet  storage but also from the customers/**consumers** if they don't have closed warehouses to store the pellet  for the complete season.

Our cover Cover Paellet aimed at covering the pallet which contains the 15 kg pellet bags. Cheap, easy to use, white, covering and UV ray resistant. The dimensions are suited for pallets with 66, 70 or 72 bags.

**CIMI S.p.A.**
